Chapter 1

Set Theory

Proposition 1.1. *Every infinite subset of a countably infinite set is countable.*

PROOF:

- $\langle 1 \rangle 1$. LET: $i : A \hookrightarrow \mathbb{N}$ be an infinite subset of \mathbb{N} .
- $\langle 1 \rangle 2$. Define $j : \mathbb{N} \rightarrow A$ by: $j(k)$ is the element such that $i(j(k))$ is least such that $i(j(k)) \notin \{i(j(0)), \dots, i(j(k-1))\}$.
- $\langle 1 \rangle 3$. j is a bijection.

□

Proposition 1.2. *A countable union of countable sets is countable.*

PROOF:

- $\langle 1 \rangle 1$. LET: (A_n) be a sequence of countable sets.
- $\langle 1 \rangle 2$. For $n \in \mathbb{N}$, PICK an enumeration $(e_{nm})_m$ of A_n .
- $\langle 1 \rangle 3$. LET: (p_k) be the following enumeration of $\mathbb{N} \times \mathbb{N}$:
 $(0, 0), (1, 0), (0, 1), (2, 0), (1, 1), (0, 2), \dots$
- $\langle 1 \rangle 4$. $(e_{\pi_1(p_k)\pi_2(p_k)})_k$ is an enumeration of $\bigcup_n A_n$.

□

Theorem 1.3. $2^{\mathbb{N}}$ is uncountable.

PROOF:

- $\langle 1 \rangle 1$. ASSUME: for a contradiction $f : \mathbb{N} \approx 2^{\mathbb{N}}$
- $\langle 1 \rangle 2$. LET: $S = \{n \in \mathbb{N} : n \notin f(n)\}$
- $\langle 1 \rangle 3$. For all n , we have $n \in S \Leftrightarrow n \notin f(n)$
- $\langle 1 \rangle 4$. For all n we have $S \neq f(n)$.
- $\langle 1 \rangle 5$. Q.E.D.

PROOF: This contradicts $\langle 1 \rangle 1$.

Chapter 2

Relations

Definition 2.1 (Antisymmetric). A relation R on a set A is *antisymmetric* iff, whenever xRy and yRx , then $x = y$.

Definition 2.2 (Transitive). A relation R on a type A is *transitive* iff, whenever xRy and yRz , then xRz .

Chapter 3

Order Theory

Definition 3.1 (Linear Order). A *linear order* on a set A is a binary relation \leq on A that is transitive, antisymmetric and:

$$\forall x, y \in A. x \leq y \vee y \leq x .$$

A *linearly ordered set* is a pair (A, \leq) where A is a set and \leq is a binary relation on A .

We write $x < y$ for $x \leq y$ and $x \neq y$.

Definition 3.2 (Upper Bound). Let S be a linearly ordered set, $u \in S$ and $E \subseteq S$. Then u is an *upper bound* in E iff $\forall x \in E. x \leq u$. We say E is *bounded above* iff it has an upper bound.

The *up-set* of E , denoted $E \uparrow$, is the set of upper bounds of E .

Definition 3.3 (Lower Bound). Let S be a linearly ordered set, $l \in S$ and $E \subseteq S$. Then l is a *lower bound* in E iff $\forall x \in E. l \leq x$. We say E is *bounded below* iff it has a lower bound.

The *down-set* of E , denoted $E \downarrow$, is the set of lower bounds of E .

Definition 3.4 (Supremum). Let S be a linearly ordered set, $u \in S$ and $E \subseteq S$. Then u is the *least upper bound* or *supremum* of E iff u is an upper bound for E and, for any upper bound u' for E , we have $u \leq u'$.

Definition 3.5 (Infimum). Let S be a linearly ordered set, $l \in S$ and $E \subseteq S$. Then l is the *greatest lower bound* or *infimum* of E iff l is a lower bound for E and, for any lower bound l' for E , we have $l' \leq l$.

Definition 3.6 (Least Upper Bound Property). A linearly ordered set S has the *least upper bound property* iff every nonempty subset of S that is bounded above has a least upper bound.

Proposition 3.7. Let S be a linearly ordered set and $E \subseteq S$.

1. If $E \downarrow$ has a supremum l , then l is the infimum of E .

2. If $E \uparrow$ has an infimum u , then U is the supremum of E .

PROOF:

- (1)1. If $E \downarrow$ has a supremum l , then l is the infimum of E .
 (2)1. l is a lower bound for E .
 (3)1. LET: $x \in E$
 (3)2. x is an upper bound for $E \downarrow$.
 PROOF: For all $y \in E \downarrow$ we have $y \leq x$.
 (3)3. $l \leq x$
 (2)2. For any lower bound l' for E , we have $l' \leq l$.
 PROOF: Since l is an upper bound for $E \downarrow$.
 (1)2. If $E \uparrow$ has an infimum u , then u is the supremum of E .
 PROOF: Dual.

□

Corollary 3.7.1. *A linearly ordered set has the least upper bound property if and only if every nonempty set bounded below has an infimum.*

Definition 3.8 (Closed Downwards). Let S be a linearly ordered set and $E \subseteq S$. Then E is *closed downwards* iff, whenever $x \in E$ and $y < x$, then $y \in E$.

Definition 3.9 (Closed Upwards). Let S be a linearly ordered set and $E \subseteq S$. Then E is *closed upwards* iff, whenever $x \in E$ and $x < y$, then $y \in E$.

Definition 3.10 (Greatest). Let S be a linearly ordered set and $u \in S$. Then u is *greatest* in S iff $\forall x \in S. x \leq u$.

Definition 3.11 (Least). Let S be a linearly ordered set and $l \in S$. Then l is *least* in S iff $\forall x \in S. l \leq x$.

Proposition 3.12. *Let \leq be a linear order on a set S and $E \subseteq S$. Then $\leq \cap E^2$ is a linear order on E .*

PROOF: Easy. □

Given a linearly ordered set (S, \leq) and $E \subseteq S$, we write just E for the linearly ordered set $(E, \leq \cap E^2)$.

Definition 3.13 (Lexicographic Order). Let A and B be linearly ordered sets. The *lexicographic order* or *dictionary order* on $A \times B$ is the order defined by

$$(a, b) \leq (a', b') \Leftrightarrow a = a' \vee (a < a' \wedge b \leq b') .$$

Proposition 3.14. *The lexicographic order is a linear order.*

Chapter 4

- $\forall x \in F. x + 0 = x$
- $\forall x \in F. \exists y \in F. x + y = 0$
- \cdot is commutative.
- \cdot is associative.
- There exists $1 \in F$ such that $1 \neq 0$ and $\forall x \in F. x1 = x$ and $\forall x \in F. x \neq 0 \Rightarrow \exists y \in F. xy = 1$
- *Distributive Law* $\forall x, y, z \in F. x(y + z) = xy + xz$

Proposition 4.2. *In any field F , the element 0 is the unique element such that $\forall x \in F. x + 0 = x$.*

$$\begin{aligned} y &= y + 0 \\ &= y + x + y' \\ &= 0 + y' \\ &= y' \end{aligned}$$

\square

Definition 4.4. Let F be a field. Let $x \in F$. We denote by $-x$ the unique element of F such that $x + (-x) = 0$.

Given $x, y \in F$, we write $x - y$ for $x + (-y)$.

Proposition 4.5. In any field F , if $x + y = x + z$ then $y = z$.

PROOF: If $x + y = x + z$ we have

$$-x + x + y = -x + x + z$$

$$\therefore 0 + y = 0 + z$$

$$\therefore y = z$$

□

$$= yxy'$$

$$= 1y'$$

$$= y'$$

□

Definition 4.9. In any field F , if $x \neq 0$, we write x^{-1} for the unique element such that $xx^{-1} = 1$.

We write x/y for xy^{-1} .

$$y = 1y$$

$$= x^{-1}xy$$

$$= x^{-1}xz$$

$$= 1z$$

$$= z$$

□

Proposition 4.11. In any field F , if $x \neq 0$ then $x^{-1} \neq 0$ and $(x^{-1})^{-1} = x$.

PROOF:

$$\begin{aligned}
 x0 + 0 &= x0 \\
 &= x(0 + 0) \\
 &= x0 + x0 \\
 \therefore 0 &= x0 \quad \square
 \end{aligned}$$

Proposition 4.13. *In any field F , if $xy = 0$ then $x = 0$ or $y = 0$.*

PROOF: If $xy = 0$ and $x \neq 0$ then we have $y = x^{-1}xy = x^{-1}0 = 0$. \square

Proposition 4.14. *In any field F , we have $(-x)y = -(xy)$.*

PROOF:

$$\begin{aligned}
 xy + (-x)y &= (x + (-x))y \\
 &= 0y \\
 &= 0 \quad (\text{Proposition 4.12}) \square
 \end{aligned}$$

Corollary 4.14.1. *In any field F , we have $(-x)(-y) = xy$.*

PROOF:

$$\begin{aligned}
 (-x)(-y) &= -(x(-y)) \\
 &= -(-(xy)) \\
 &= xy \quad (\text{Proposition 4.6}) \square
 \end{aligned}$$

PROOF:

$$\begin{aligned}
 a^2 - b^2 &= 0 \\
 \therefore (a - b)(a + b) &= 0
 \end{aligned}$$

Hence either $a - b = 0$ or $a + b = 0$, and the conclusion follows. \square
