## Set Theory

**Proposition 1.1.** *Every infinite subset of a countably infinite set is countable.*

PROOF:

- $\langle 1 \rangle 1$ . LET:  $i : A \hookrightarrow \mathbb{N}$  be an infinite subset of  $\mathbb{N}$ .
- $\langle 1 \rangle 2$ . Define  $j : \mathbb{N} \rightarrow A$  by:  $j(k)$  is the element such that  $i(j(k))$  is least such that  $i(j(k)) \notin \{i(j(0)), \dots, i(j(k-1))\}$ .
- $\langle 1 \rangle 3$ .  $j$  is a bijection.

□

**Proposition 1.2.** *A countable union of countable sets is countable.*

PROOF:

- $\langle 1 \rangle 1$ . LET:  $(A_n)$  be a sequence of countable sets.
- $\langle 1 \rangle 2$ . For  $n \in \mathbb{N}$ , PICK an enumeration  $(e_{nm})_m$  of  $A_n$ .
- $\langle 1 \rangle 3$ . LET:  $(p_k)$  be the following enumeration of  $\mathbb{N} \times \mathbb{N}$ :  
 $(0, 0), (1, 0), (0, 1), (2, 0), (1, 1), (0, 2), \dots$
- $\langle 1 \rangle 4$ .  $(e_{\pi_1(p_k)\pi_2(p_k)})_k$  is an enumeration of  $\bigcup_n A_n$ .

□

**Theorem 1.3.**  $2^{\mathbb{N}}$  is uncountable.

PROOF:

- $\langle 1 \rangle 1$ . ASSUME: for a contradiction  $f : \mathbb{N} \approx 2^{\mathbb{N}}$
- $\langle 1 \rangle 2$ . LET:  $S = \{n \in \mathbb{N} : n \notin f(n)\}$
- $\langle 1 \rangle 3$ . For all  $n$ , we have  $n \in S \Leftrightarrow n \notin f(n)$
- $\langle 1 \rangle 4$ . For all  $n$  we have  $S \neq f(n)$ .
- $\langle 1 \rangle 5$ . Q.E.D.

PROOF: This contradicts  $\langle 1 \rangle 1$ .

# Relations

**Definition 2.1** (Antisymmetric). A relation  $R$  on a set  $A$  is *antisymmetric* iff, whenever  $xRy$  and  $yRx$ , then  $x = y$ .

**Definition 2.2** (Transitive). A relation  $R$  on a type  $A$  is *transitive* iff, whenever  $xRy$  and  $yRz$ , then  $xRz$ .

## Chapter 3

# Order Theory

**Definition 3.1** (Linear Order). A *linear order* on a set  $A$  is a binary relation  $\leq$  on  $A$  that is transitive, antisymmetric and:

$$\forall x, y \in A. x \leq y \vee y \leq x .$$

A *linearly ordered set* is a pair  $(A, \leq)$  where  $A$  is a set and  $\leq$  is a binary relation on  $A$ .

We write  $x < y$  for  $x \leq y$  and  $x \neq y$ .

**Definition 3.2** (Upper Bound). Let  $S$  be a linearly ordered set,  $u \in S$  and  $E \subseteq S$ . Then  $u$  is an *upper bound* in  $E$  iff  $\forall x \in E. x \leq u$ . We say  $E$  is *bounded above* iff it has an upper bound.

The *up-set* of  $E$ , denoted  $E \uparrow$ , is the set of upper bounds of  $E$ .

**Definition 3.3** (Lower Bound). Let  $S$  be a linearly ordered set,  $l \in S$  and  $E \subseteq S$ . Then  $l$  is a *lower bound* in  $E$  iff  $\forall x \in E. l \leq x$ . We say  $E$  is *bounded below* iff it has a lower bound.

The *down-set* of  $E$ , denoted  $E \downarrow$ , is the set of lower bounds of  $E$ .

**Definition 3.4** (Supremum). Let  $S$  be a linearly ordered set,  $u \in S$  and  $E \subseteq S$ . Then  $u$  is the *least upper bound* or *supremum* of  $E$  iff  $u$  is an upper bound for  $E$  and, for any upper bound  $u'$  for  $E$ , we have  $u \leq u'$ .

**Definition 3.5** (Infimum). Let  $S$  be a linearly ordered set,  $l \in S$  and  $E \subseteq S$ . Then  $l$  is the *greatest lower bound* or *infimum* of  $E$  iff  $l$  is a lower bound for  $E$  and, for any lower bound  $l'$  for  $E$ , we have  $l' \leq l$ .

**Definition 3.6** (Least Upper Bound Property). A linearly ordered set  $S$  has the *least upper bound property* iff every nonempty subset of  $S$  that is bounded above has a least upper bound.

**Proposition 3.7.** Let  $S$  be a linearly ordered set and  $E \subseteq S$ .

1. If  $E \downarrow$  has a supremum  $l$ , then  $l$  is the infimum of  $E$ .

2. If  $E \uparrow$  has an infimum  $u$ , then  $U$  is the supremum of  $E$ .

PROOF:

- (1)1. If  $E \downarrow$  has a supremum  $l$ , then  $l$  is the infimum of  $E$ .  
 (2)1.  $l$  is a lower bound for  $E$ .  
 (3)1. LET:  $x \in E$   
 (3)2.  $x$  is an upper bound for  $E \downarrow$ .  
 PROOF: For all  $y \in E \downarrow$  we have  $y \leq x$ .  
 (3)3.  $l \leq x$   
 (2)2. For any lower bound  $l'$  for  $E$ , we have  $l' \leq l$ .  
 PROOF: Since  $l$  is an upper bound for  $E \downarrow$ .  
 (1)2. If  $E \uparrow$  has an infimum  $u$ , then  $u$  is the supremum of  $E$ .  
 PROOF: Dual.

□

**Corollary 3.7.1.** *A linearly ordered set has the least upper bound property if and only if every nonempty set bounded below has an infimum.*

**Definition 3.8** (Closed Downwards). Let  $S$  be a linearly ordered set and  $E \subseteq S$ . Then  $E$  is *closed downwards* iff, whenever  $x \in E$  and  $y < x$ , then  $y \in E$ .

**Definition 3.9** (Closed Upwards). Let  $S$  be a linearly ordered set and  $E \subseteq S$ . Then  $E$  is *closed upwards* iff, whenever  $x \in E$  and  $x < y$ , then  $y \in E$ .

**Definition 3.10** (Greatest). Let  $S$  be a linearly ordered set and  $u \in S$ . Then  $u$  is *greatest* in  $S$  iff  $\forall x \in S. x \leq u$ .

**Definition 3.11** (Least). Let  $S$  be a linearly ordered set and  $l \in S$ . Then  $l$  is *least* in  $S$  iff  $\forall x \in S. l \leq x$ .

**Proposition 3.12.** *Let  $\leq$  be a linear order on a set  $S$  and  $E \subseteq S$ . Then  $\leq \cap E^2$  is a linear order on  $E$ .*

PROOF: Easy. □

Given a linearly ordered set  $(S, \leq)$  and  $E \subseteq S$ , we write just  $E$  for the linearly ordered set  $(E, \leq \cap E^2)$ .

**Definition 3.13** (Lexicographic Order). Let  $A$  and  $B$  be linearly ordered sets. The *lexicographic order* or *dictionary order* on  $A \times B$  is the order defined by

$$(a, b) \leq (a', b') \Leftrightarrow a = a' \vee (a < a' \wedge b \leq b') .$$

**Proposition 3.14.** *The lexicographic order is a linear order.*

- There exists  $1 \in F$  such that  $1 \neq 0$  and  $\forall x \in F. x1 = x$  and  $\forall x \in F. x \neq 0 \Rightarrow \exists y \in F. xy = 1$
- *Distributive Law*  $\forall x, y, z \in F. x(y + z) = xy + xz$

**Proposition 4.2.** *In any field  $F$ , the element  $0$  is the unique element such that  $\forall x \in F. x + 0 = x$ .*

PROOF: If  $0$  and  $0'$  both have this property then  $0 = 0 + 0' = 0'$ .  $\square$

**Proposition 4.3.** *In any field  $F$ , given  $x \in F$ , there is a unique  $y \in F$  such that  $x + y = 0$ .*

PROOF: If  $x + y = x + y' = 0$  then

$$\begin{aligned} y &= y + 0 \\ &= y + x + y' \\ &= 0 + y' \\ &= y' \end{aligned}$$

$\square$

**Definition 4.4.** Let  $F$  be a field. Let  $x \in F$ . We denote by  $-x$  the unique element of  $F$  such that  $x + (-x) = 0$ .

Given  $x, y \in F$ , we write  $x - y$  for  $x + (-y)$ .

**Proposition 4.5.** In any field  $F$ , if  $x + y = x + z$  then  $y = z$ .

$$-x + x + y = -x + x + z$$

$$\therefore 0 + y = 0 + z$$

$$\therefore y = z \quad \square$$

**Proposition 4.6.** In any field  $F$ , we have  $-(-x) = x$ .

PROOF: Since  $x + (-x) = 0$ .  $\square$

**Proposition 4.7.** In any field  $F$ , the element  $1$  such that  $\forall x \in F. x1 = x$  is unique.

PROOF: If  $y$  and  $y'$  both have this property then we have

$$y = y1$$

$$= yxy'$$

$$= 1y'$$

$$= y' \quad \square$$

**Definition 4.9.** In any field  $F$ , if  $x \neq 0$ , we write  $x^{-1}$  for the unique element such that  $xx^{-1} = 1$ .

We write  $x/y$  for  $xy^{-1}$ .

**Proposition 4.10.** In any field  $F$ , if  $xy = xz$  and  $x \neq 0$  then  $y = z$ .

$$y = 1y$$

$$= x^{-1}xy$$

$$= x^{-1}xz$$

$$= 1z$$

$$= z \quad \square$$

PROOF: Since  $xx^{-1} = 1$ .  $\square$

**Proposition 4.12.** In any field  $F$ , we have  $x0 = 0$ .

PROOF:

$$\begin{aligned}
 x0 + 0 &= x0 \\
 &= x(0 + 0) \\
 &= x0 + x0 \\
 \therefore 0 &= x0 \quad \square
 \end{aligned}$$

**Proposition 4.13.** *In any field  $F$ , if  $xy = 0$  then  $x = 0$  or  $y = 0$ .*

$$\begin{aligned}
 xy + (-x)y &= (x + (-x))y \\
 &= 0y \\
 &= 0 \quad (\text{Proposition 4.12}) \square
 \end{aligned}$$

**Corollary 4.14.1.** *In any field  $F$ , we have  $(-x)(-y) = xy$ .*

PROOF:

$$\begin{aligned}
 (-x)(-y) &= -(x(-y)) \\
 &= -(-(xy)) \\
 &= xy \quad (\text{Proposition 4.6}) \square
 \end{aligned}$$

**Proposition 4.15.** *Let  $K$  be a field. Let  $a, b \in K$ . If  $a^2 = b^2$  then  $a = b$  or  $a = -b$ .*

PROOF:

$$\begin{aligned}
 a^2 - b^2 &= 0 \\
 \therefore (a - b)(a + b) &= 0
 \end{aligned}$$

Hence either  $a - b = 0$  or  $a + b = 0$ , and the conclusion follows.  $\square$

## 4.1 Ordered Fields

**Definition 4.16** (Ordered Field). An *ordered field*  $F$  consists of a field  $F$  and a linear order  $\leq$  on  $F$  such that:

- For all  $x, y \in F$ , if  $x > 0$  and  $y > 0$  then  $xy > 0$ .

We call  $x$  *positive* iff  $x > 0$  and *negative* iff  $x < 0$ .

## Metric Spaces

**Definition 11.1** (Metric). A *metric* on a set  $X$  is a function  $d : X^2 \rightarrow \mathbb{R}$  such that, for all  $x, y, z \in X$ :

- $d(x, y) = d(y, x)$
- **Triangle Inequality**  $d(x, z) \leq d(x, y) + d(y, z)$

A *metric space*  $X$  consists of a set  $X$  and a metric on  $X$ .

**Proposition 11.4.** Let  $(X, d)$  be a metric space and  $Y$  a subset of  $X$ . Then  $d \upharpoonright Y^2$  is a metric on  $Y$ .
