Foundations

This is a placeholder — I am not sure what foundation I want to use for this project yet. I will try to work in a way which is foundation-independent. What I do could be formalized in ZFC, ETCS, or some other system. I will assume the usual set theoretic constructions as needed. Sets will be defined up to bijection only.

Chapter 2

Categories

Definition 2.1 (Category)**.** A *category* $\mathcal{C}$ consists of:

- A class $|\mathcal{C}|$ of *objects*. We write $A \in \mathcal{C}$ for $A \in |\mathcal{C}|$.
- For any objects A, B, a set $\mathcal{C}[A, B]$ of *morphisms* from A to B. We write $f : A \to B$ for $f \in \mathcal{C}[A, B]$.
- For any object A, a morphism $\mathrm{id}_A : A \to A$, the *identity* morphism on A.
- For any morphisms $f : A \to B$ and $g : B \to C$, a morphism $g \circ f : A \to C$, the *composite* of f and g.

such that:

Associativity Given $f : A \to B$, $g : B \to C$ and $h : C \to D$, we have $h \circ (g \circ f) = (h \circ g) \circ f$

Left Unit Law For any morphism $f : A \to B$, we have $\mathrm{id}_B \circ f = f$.

Right Unit Law For any morphism $f : A \to B$, we have $f \circ \mathrm{id}_A = f$.

Proposition 2.2. *The identity morphism on an object is unique.*

Proof: If i and j are identity morphisms on A then $i = i \circ j = j$. □

Example 2.3 (Category of Sets)**.** The *category of sets* **Set** has objects all sets and morphisms all functions.

Definition 2.4 (Endomorphism)**.** In a category $\mathcal{C}$, an *endomorphism* on an object A is a morphism $A \to A$. We write $\mathrm{End}_{\mathcal{C}}(A)$ for $\mathcal{C}[A, A]$.

Definition 2.5 (Opposite Category)**.** For any category $\mathcal{C}$, the *opposite* category $\mathcal{C}^{\mathrm{op}}$ is the category with the same objects as $\mathcal{C}$ and

$$\mathcal{C}^{\mathrm{op}}[A, B] = \mathcal{C}[B, A]$$

2.1 Preorders

Definition 2.6 (Preorder)**.** A *preorder* on a set A is a relation $\leq$ on A that is reflexive and transitive.

A *preordered set* is a pair $(A, \leq)$ such that $\leq$ is a preorder on A. We usually write A for the preordered set $(A, \leq)$.

We identify any preordered set A with the category whose objects are the elements of A, with one morphism $a \to b$ iff $a \leq b$, and no morphism $a \to b$ otherwise.

Example 2.7. For any ordinal α, let α be the preorder $\{\beta : \beta < \alpha\}$ under $\leq$.

Definition 2.8 (Discrete Preorder)**.** We identify any set A with the *discrete* preorder $(A, =)$.

2.2 Monomorphisms and Epimorphisms

Definition 2.9 (Monomorphism)**.** In a category, let $f : A \to B$. Then f is a *monomorphism* or *monic* iff, for every object X and morphism $x, y : X \to A$, if $fx = fy$ then $x = y$.

Definition 2.10 (Epimorphism)**.** In a category, let $f : A \to B$. Then f is a *epimorphism* or *epi* iff, for every object X and morphism $x, y : B \to X$, if $xf = yf$ then $x = y$.

Proposition 2.11. *The composite of two monomorphism is monic.*

Proof:
$\langle 1 \rangle 1.$ Let: $f : A \rightarrowtail B$ and $g : B \rightarrowtail C$ be monic.
$\langle 1 \rangle 2.$ Let: $x, y : X \to A$
$\langle 1 \rangle 3.$ Assume: $g \circ f \circ x = g \circ f \circ y$
$\langle 1 \rangle 4.$ $f \circ x = f \circ y$
$\langle 1 \rangle 5.$ $x = y$

Proposition 2.14. *Let $f : A \to B$ and $g : B \to C$. If $g \circ f$ is epi then g is epi.*

Proof: Dual. $\square$

Proposition 2.15. *A function is a monomorphism in* **Set** *iff it is injective.*

$\langle 2\rangle 5$. $f \circ \overline{x} = f \circ \overline{y}$
$\langle 2\rangle 6$. $\overline{x} = \overline{y}$
PROOF: By $\langle 2\rangle 1$.
$\langle 2\rangle 7$. $x = y$
$\langle 1\rangle 3$. If f is injective then f is monic.
$\langle 2\rangle 1$. ASSUME: f is injective.
$\langle 2\rangle 2$. LET: X be a set and $x, y : X \to A$.
$\langle 2\rangle 3$. ASSUME: $f \circ x = f \circ y$
PROVE: $x = y$

PROVE: $x(t) = y(t)$
$\langle 2\rangle 5$. $f(x(t)) = f(y(t))$
$\langle 2\rangle 6$. $x(t) = y(t)$
PROOF: By $\langle 2\rangle 1$.
□

Proposition 2.16. *A function is an epimorphism in* **Set** *iff it is surjective.*

PROOF:
$\langle 1\rangle 1$. LET: $f : A \to B$
$\langle 1\rangle 2$. If f is an epimorphism then f is surjective.
$\langle 2\rangle 1$. ASSUME: f is an epimorphism.

$\langle 2\rangle 3$. LET: $x, y : B \to 2$ be defined by $x(b) = 1$ and $x(t) = 0$ for all other $t \in B$, $y(t) = 0$ for all $t \in B$.
$\langle 2\rangle 4$. $x \neq y$
$\langle 2\rangle 5$. $x \circ f \neq y \circ f$
$\langle 2\rangle 6$. There exists $a \in A$ such that $f(a) = b$.
$\langle 1\rangle 3$. If f is surjective then f is an epimorphism.
$\langle 2\rangle 1$. ASSUME: f is surjective.
$\langle 2\rangle 2$. LET: $x, y : B \to X$
$\langle 2\rangle 3$. ASSUME: $x \circ f = y \circ f$
PROVE: $x = y$

□

Proposition 2.17. *In a preorder, every morphism is monic and epi.*

PROOF: Immediate from definitions. □

2.3 Sections and Retractions

Definition 2.18 (Section, Retraction)**.** In a category, let $r : A \to B$ and $s : B \to A$. Then r is a *retraction* of s, and s is a *section* of r, iff $r \circ s = \mathrm{id}_B$.

Proposition 2.19. *Every identity morphism is a section and retraction of itself.*

PROOF: Immediate from definitions. □

Proposition 2.20. *Let $r, r' : A \to B$ and $s : B \to A$. If r is a retraction of s and r' is a section of s then $r = r'$.*

PROOF:

$$\begin{aligned} r &= r \circ \mathrm{id}_A \\ &= r \circ s \circ r' \\ &= \mathrm{id}_B \circ r' \\ &= r' \end{aligned}$$

□

Proposition 2.21. *Let $r_1 : A \to B$, $r_2 : B \to C$, $s_1 : B \to A$ and $s_2 : C \to B$. If r_1 is a retraction of s_1 and r_2 is a retraction of s_2 then $r_2 \circ r_1$ is a retraction of $s_1 \circ s_2$.*

PROOF:

$$\begin{aligned} r_2 \circ r_1 \circ s_1 \circ s_2 &= r_2 \circ \mathrm{id}_B \circ s_2 \\ &= r_2 \circ s_2 \\ &= \mathrm{id}_C \end{aligned}$$

□

Proposition 2.22. *Every section is monic.*

PROOF:
⟨1⟩1. LET: $s : A \to B$ be a section of $r : B \to A$.
⟨1⟩2. LET: $x, y : X \to A$ satisfy $sx = sy$.
⟨1⟩3. $rsx = rsy$
⟨1⟩4. $x = y$
□

Proposition 2.23. *Every retraction is epi.*

PROOF: Dual. □

Proposition 2.24. *In* **Set**, *every epimorphism has a retraction.*

PROOF: By the Axiom of Choice. □

Example 2.25. It is not true in general that every monomorphism in any category has a section. nor that every epimorphism in any category has a retraction.

In the category **2**, the morphism $0 \leq 1$ is monic and epi but has no retraction or section.

2.4 Isomorphisms

Definition 2.26 (Isomorphism)**.** In a category $\mathcal{C}$, a morphism $f : A \to B$ is an *isomorphism*, denoted $f : A \cong B$, iff there exists a morphism $f^{-1} : B \to A$, the *inverse* of f, such that $f^{-1} \circ f = \mathrm{id}_A$ and $f \circ f^{-1} = \mathrm{id}_B$.

An *automorphism* on an object A is an isomorphism between A and itself. We write $\mathrm{Aut}_{\mathcal{C}}(A)$ for the set of all automorphisms on A.

Objects A and B are *isomorphic*, $A \cong B$, iff there exists an isomorphism between them.

Proposition 2.27. *The inverse of an isomorphism is unique.*

PROOF: Proposition 2.20. ∎

Proposition 2.28. *For any object A we have $\mathrm{id}_A : A \cong A$ and $\mathrm{id}_A^{-1} = \mathrm{id}_A$.*

PROOF: Since $\mathrm{id}_A \circ \mathrm{id}_A = \mathrm{id}_A$ by the Unit Laws. ∎

Proposition 2.29. *If $f : A \cong B$ then $f^{-1} : B \cong A$ and $(f^{-1})^{-1} = f$.*

PROOF: Immediate from definitions. ∎

Proposition 2.30. *If $f : A \cong B$ and $g : B \cong C$ then $g \circ f : A \cong C$ and $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$.*

PROOF: From Proposition 2.21. ∎

Definition 2.31 (Groupoid)**.** A *groupoid* is a category in which every morphism is an isomorphism.

2.5 Initial and Terminal Objects

Definition 2.32 (Initial Object)**.** An object I in a category is *initial* iff, for any object X, there is exactly one morphism $I \to X$.

Example 2.33. The empty set is the initial object in **Set**.

Definition 2.34 (Terminal Object)**.** An object T in a category is *terminal* iff, for any object X, there is exactly one morphism $X \to T$.

Example 2.35. Every singleton is terminal in **Set**.

Proposition 2.36. *If I and J are initial in a category, then there exists a unique isomorphism $I \cong J$.*

PROOF:
⟨1⟩1. LET: i be the unique morphism $I \to J$.
⟨1⟩2. LET: i^{-1} be the unique morphism $J \to I$.
⟨1⟩3. $i \circ i^{-1} = \mathrm{id}_J$
  PROOF: Since there is only one morphism $J \to J$.
⟨1⟩4. $i^{-1} \circ i = \mathrm{id}_I$

Proof: Since there is only one morphism $I \to I$.
□

Proposition 2.37. *If S and T are terminal in a category, then there exists a unique isomorphism $S \cong T$.*

Proof: Dual. □

Chapter 3

Functors

Definition 3.1 (Functor)**.** Let $\mathcal{C}$ and $\mathcal{D}$ be categories. A *functor* $F : \mathcal{C} \to \mathcal{D}$ consists of:

- for every object $A \in \mathcal{C}$, an object $FA \in \mathcal{D}$
- for any morphism $f : A \to B : \mathcal{C}$, a morphism $Ff : FA \to FB : \mathcal{D}$

such that:

- $F\mathrm{id}_A = \mathrm{id}_{FA}$
- $F(g \circ f) = Fg \circ Ff$

Definition 3.2 (Identity Functor)**.** For any category $\mathcal{C}$, the *identity functor* $1_{\mathcal{C}} : \mathcal{C} \to \mathcal{C}$ is defined by

$$
\begin{aligned}
1_{\mathcal{C}}A &= A \\
1_{\mathcal{C}}f &= f
\end{aligned}
$$

Definition 3.3 (Constant Functor)**.** Given categories $\mathcal{C}$, $\mathcal{D}$ and an object $D \in \mathcal{D}$, the *constant functor* $K^{\mathcal{C}}D : \mathcal{C} \to \mathcal{D}$ is the functor defined by

$$
\begin{aligned}
K^{\mathcal{C}}DC &= D \\
K^{\mathcal{C}}Df &= \mathrm{id}_D
\end{aligned}
$$

3.1 Comma Categories

Definition 3.4 (Comma Category)**.** Let $F : \mathcal{C} \to \mathcal{E}$ and $G : \mathcal{D} \to \mathcal{E}$ be functors. The *comma category* $F \downarrow G$ is the category with:

- objects all pairs (C, D, f) where $C \in \mathcal{C}$, $D \in \mathcal{D}$ and $f : FC \to GD : \mathcal{E}$

- morphisms $(u, v) : (C, D, f) \to (C', D', g)$ all pairs $u : C \to C' : \mathcal{C}$ and $v : D \to D' : \mathcal{D}$ such that the following diagram commutes:

$$\begin{array}{ccc} FC & \xrightarrow{f} & GD \\ \downarrow{\scriptstyle Fu} & & \downarrow{\scriptstyle Gv} \\ FC' & \xrightarrow{g} & GD' \end{array}$$

Definition 3.5 (Slice Category)**.** Let $\mathcal{C}$ be a category and $A \in \mathcal{C}$. The *slice category* over A, denoted $\mathcal{C}/A$, is the comma category $1_{\mathcal{C}} \downarrow K^{\mathbf{1}}A$.

Definition 3.6 (Coslice Category)**.** Let $\mathcal{C}$ be a category and $A \in \mathcal{C}$. The *coslice category* over A, denoted $\mathcal{C}\backslash A$, is the comma category $K^{\mathbf{1}}A \downarrow 1_{\mathcal{C}}$.

Definition 3.7 (Pointed Sets)**.** The *category of pointed sets* $\mathbf{Set}_*$ is the coslice category $\mathbf{Set}\backslash 1$.

Chapter 4

Monoids

Definition 4.1 (Monoid)**.** A *monoid* consists of a set M and a binary operation $\cdot : M^2 \to M$ such that:

- $\cdot$ is associative
- There exists $e \in M$ such that, for all $x \in M$, we have $xe = ex = x$.

We identify a monoid M with the category with one object whose morphisms are the elements of M, with composition given by $\cdot$.

Proposition 4.2. *The identity in a group is unique.*

PROOF: Proposition 2.2.

Chapter 5

Groups

Definition 5.1 (Group)**.** Let $\mathcal{C}$ be a category with finite products. A *group (object)* in $\mathcal{C}$ consists of an object $G \in \mathcal{C}$ and morphisms

$$m : G^2 \to G, e : 1 \to G, i : G \to G$$

such that the following diagrams commute.

$$\begin{tikzcd} G^3 \arrow[r, "m\times \mathrm{id}_G"] \arrow[d, "\mathrm{id}_G\times m"] & G^2 \arrow[d, "m"] \\ G^2 \arrow[r, "m"] & G \end{tikzcd}$$

$$\begin{tikzcd} 1\times G \arrow[r, "e\times \mathrm{id}_G"] \arrow[dr, "\cong"] & G^2 \arrow[d, "m"] \\ & G \end{tikzcd} \qquad \begin{tikzcd} G\times 1 \arrow[r, "\mathrm{id}_G\times e"] \arrow[dr, "\cong"] & G^2 \arrow[d, "m"] \\ & G \end{tikzcd}$$

$$\begin{tikzcd} G \arrow[r, "\Delta"] \arrow[d] & G^2 \arrow[r, "\mathrm{id}_G\times i"] & G^2 \arrow[d, "m"] \\ 1 \arrow[rr, "e"] & & G \end{tikzcd} \qquad \begin{tikzcd} G \arrow[r, "\Delta"] \arrow[d] & G^2 \arrow[r, "i\times \mathrm{id}_G"] & G^2 \arrow[d, "m"] \\ 1 \arrow[rr, "e"] & & G \end{tikzcd}$$

Definition 5.2 (Group)**.** We write just 'group' for 'group in **Set**. Thus, a *group* G consists of a set G and a binary operation $\cdot : G^2 \to G$ such that $\cdot$ is associative, and there exists $e \in G$, the *identity* element of the group, such that:

- For all $x \in G$ we have $xe = ex = x$
- For all $x \in G$, there exists $x^{-1} \in G$, the *inverse* of x, such that $xx^{-1} = x^{-1}x = e$.

The *order* of a group G, denoted $|G|$, is the number of elements in G if G is finite; otherwise we write $|G| = \infty$.

Proposition 5.3. *The inverse of an element is unique.*

PROOF: If i and j are inverses of x then $i = ixj = j$. □

Example 5.4.

- The *trivial* group is $\{e\}$ under $ee = e$.
- $\mathbb{Z}$ is a group under addition
- $\mathbb{Q}$ is a group under addition
- $\mathbb{Q} - \{0\}$ is a group under multiplication
- $\mathbb{R}$ is a group under addition
- $\mathbb{R} - \{0\}$ is a group under multiplication
- $\mathbb{C}$ is a group under addition
- $\mathbb{C} - \{0\}$ is a group under multiplication
- $\{-1, 1\}$ is a group under multiplication
- For any category $\mathcal{C}$ and object $A \in \mathcal{C}$, we have $\mathrm{Aut}_{\mathcal{C}}(A)$ is a group under $gf = f \circ g$.

  For A a set, we call $S_A = \mathrm{Aut}_{\mathbf{Set}}(A)$ the *symmetric group* or *group of permutations* of A.
- For $n \geq 3$, the *dihedral group* D_{2n} consists of the set of rigid motions that map the regular n-gon onto itself under composition.
- Let $SL_2(\mathbb{Z}) = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix} : a, b, c, d \in \mathbb{Z}, ad - bc = 1 \right\}$ under matrix multiplication.

Example 5.5.

- The only group of order 1 is the trivial group.
- The only group of order 2 is $\mathbb{Z}_2$.
- The only group of order 3 is $\mathbb{Z}_3$.
- There are exactly two groups of order 4: $\mathbb{Z}_4$ and $\mathbb{Z}_2 \times \mathbb{Z}_2$ under $(a, b)(c, d) = (ac, bd)$.

Proposition 5.6 (Cancellation)**.** *Let G be a group. Let $a, g, h \in G$. If $ag = ah$ or $ga = ha$ then $g = h$.*

PROOF: If $ag = ah$ then $g = a^{-1}ag = a^{-1}ah = h$. Similarly if $ga = ha$. □

Definition 5.11 (Commute)**.** Let G be a group and $g, h \in G$. We say g and h *commute* iff $gh = hg$.

Definition 5.12. Let G be a group. Given $g \in G$ and $A \subseteq G$, we define

$$gA = \{ga : a \in A\}, \qquad Ag = \{ag : a \in A\} \ .$$

Given sets $A, B \subseteq G$, we define

$$AB = \{ab : a \in A, b \in B\} \ .$$

5.1 Order of an Element

Definition 5.13 (Order)**.** Let G be a group. Let $g \in G$. Then g has *finite order* iff there exists a positive integer n such that $g^n = e$. In this case, the *order* of g, denoted $|g|$, is the least positive integer n such that $g^n = e$.

If g does not have finite order, we write $|g| = \infty$.

Proposition 5.14. *Let G be a group. Let $g \in G$ and n be a positive integer. If $g^n = e$ then $|g| \mid n$.*

⟨1⟩3. $d = 0$
PROOF: By minimality of $|g|$.
⟨1⟩4. $n = q|g|$
□

Corollary 5.14.1. *Let G be a group. Let $g \in G$ have finite order and $n \in \mathbb{Z}$. Then $g^n = e$ if and only if $|g| \mid n$.*

Proposition 5.15. *Let G be a group and $g \in G$. Then $|g| \leq |G|$.*

PROOF:
⟨1⟩1. ASSUME: w.l.o.g. G is finite.
⟨1⟩2. PICK i, j with $0 \leq i < j \leq |G|$ such that $g^i = g^j$.
PROOF: Otherwise $g^0, g^1, \ldots, g^{|G|}$ would be $|G| + 1$ distinct elements of G.
⟨1⟩3. $g^{j-i} = e$
⟨1⟩4. g has finite order and $|g| \leq |G|$
PROOF: Since $|g| \leq j - i \leq j \leq |G|$.

Proposition 5.16. *Let G be a group. Let $g \in G$ have finite order. Let $m \in \mathbb{N}$. Then*

$$|g^m| = \frac{\operatorname{lcm}(m, |g|)}{m} = \frac{|g|}{\gcd(m, |g|)}$$

PROOF: Since for any integer d we have

$$\begin{aligned} g^{md} = e &\Leftrightarrow |g| \mid md && \text{(Corollary 5.14.1)} \\ &\Leftrightarrow \operatorname{lcm}(m, |g|) \mid md \\ &\Leftrightarrow \frac{\operatorname{lcm}(m, |g|)}{m} \mid d && \square \end{aligned}$$

PROOF: Since $(gh)^{\operatorname{lcm}(|g|,|h|)} = g^{\operatorname{lcm}(|g|,|h|)} h^{\operatorname{lcm}(|g|,|h|)} = e$. □

Example 5.18. This example shows that we cannot remove the hypothesis that $gh = hg$.

In $\mathrm{GL}_2(\mathbb{R})$, take

$$g = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}, \qquad h = \begin{pmatrix} 0 & 1 \\ -1 & -1 \end{pmatrix} .$$

Then $|g| = 4$, $|h| = 3$ and $|gh| = \infty$.

Abelian Groups

Definition 7.1 (Abelian Group)**.** A group is *Abelian* iff any two elements commute.

Definition 9.4 (Zero Divisor)**.** Let R be a rng and $a \in R$.

Then a is a *left-zero-divisor* iff there exists $b \in R - \{0\}$ such that $ab = 0$.

Example 9.5. 0 is a left- and right-zero-divisor in every non-zero rng.

The zero rng is the only ring with no zero-divisors.

Proposition 9.6. *Let R be a rng and $a \in R$. Then a is not a left-zero-divisor if and only if left multiplication by a is an injective function $R \to R$.*

PROOF:

⟨1⟩1. If a is not a left-zero-divisor then left multiplication by a is injective.

⟨2⟩1. ASSUME: a is not a left-zero-divisor.

⟨2⟩2. LET: $ab = ac$

⟨2⟩3. $a(b - c) = 0$

⟨2⟩4. $b - c = 0$

⟨2⟩5. $b = c$

⟨1⟩2. If a is a left-zero-divisor then left multiplication by a is not injective.

⟨2⟩1. PICK $b \neq 0$ such that $ab = 0$.

⟨2⟩2. $ab = a0$ but $b \neq 0$

10.1 Units

Definition 10.5 (Left-Unit, Right-Unit)**.** Let R be a ring and $a \in R$. Then a is a *left-unit* iff there exists $b \in R$ such that $ab = 1$. The element a is a *right-unit* iff there exists $b \in R$ such that $ba = 1$.

An element is a *unit* iff it is a left-unit and a right-unit.
