Foundations

This is a placeholder — I am not sure what foundation I want to use for this project yet. I will try to work in a way which is foundation-independent. What I do could be formalized in ZFC, ETCS, or some other system. I will assume the usual set theoretic constructions as needed. Sets will be defined up to bijection only.

Chapter 2

Categories

Definition 2.1 (Category)**.** A *category* $\mathcal{C}$ consists of:

- A class $|\mathcal{C}|$ of *objects*. We write $A \in \mathcal{C}$ for $A \in |\mathcal{C}|$.
- For any objects A, B, a set $\mathcal{C}[A, B]$ of *morphisms* from A to B. We write $f : A \to B$ for $f \in \mathcal{C}[A, B]$.
- For any object A, a morphism $\mathrm{id}_A : A \to A$, the *identity* morphism on A.
- For any morphisms $f : A \to B$ and $g : B \to C$, a morphism $g \circ f : A \to C$, the *composite* of f and g.

such that:

Associativity Given $f : A \to B$, $g : B \to C$ and $h : C \to D$, we have $h \circ (g \circ f) = (h \circ g) \circ f$

Left Unit Law For any morphism $f : A \to B$, we have $\mathrm{id}_B \circ f = f$.

Right Unit Law For any morphism $f : A \to B$, we have $f \circ \mathrm{id}_A = f$.

Proposition 2.2. *The identity morphism on an object is unique.*

PROOF: If i and j are identity morphisms on A then $i = i \circ j = j$. $\square$

Example 2.3 (Category of Sets)**.** The *category of sets* **Set** has objects all sets and morphisms all functions.

Definition 2.4 (Endomorphism)**.** In a category $\mathcal{C}$, an *endomorphism* on an object A is a morphism $A \to A$. We write $\mathrm{End}_{\mathcal{C}}(A)$ for $\mathcal{C}[A, A]$.

Definition 2.5 (Opposite Category)**.** For any category $\mathcal{C}$, the *opposite* category $\mathcal{C}^{\mathrm{op}}$ is the category with the same objects as $\mathcal{C}$ and

$$\mathcal{C}^{\mathrm{op}}[A, B] = \mathcal{C}[B, A]$$

2.1 Preorders

Definition 2.6 (Preorder)**.** A *preorder* on a set A is a relation $\leq$ on A that is reflexive and transitive.

A *preordered set* is a pair $(A, \leq)$ such that $\leq$ is a preorder on A. We usually write A for the preordered set $(A, \leq)$.

We identify any preordered set A with the category whose objects are the elements of A, with one morphism $a \to b$ iff $a \leq b$, and no morphism $a \to b$ otherwise.

Example 2.7. For any ordinal α, let α be the preorder $\{\beta : \beta < \alpha\}$ under $\leq$.

Definition 2.8 (Discrete Preorder)**.** We identify any set A with the *discrete* preorder $(A, =)$.

2.2 Monomorphisms and Epimorphisms

Definition 2.9 (Monomorphism)**.** In a category, let $f : A \to B$. Then f is a *monomorphism* or *monic* iff, for every object X and morphism $x, y : X \to A$, if $fx = fy$ then $x = y$.

Definition 2.10 (Epimorphism)**.** In a category, let $f : A \to B$. Then f is a *epimorphism* or *epi* iff, for every object X and morphism $x, y : B \to X$, if $xf = yf$ then $x = y$.

Proposition 2.11. *The composite of two monomorphism is monic.*

$\langle 2\rangle 4$. $x \neq y$
$\langle 2\rangle 5$. $x \circ f \neq y \circ f$
$\langle 2\rangle 6$. There exists $a \in A$ such that $f(a) = b$.
$\langle 1\rangle 3$. If f is surjective then f is an epimorphism.
$\langle 2\rangle 1$. ASSUME: f is surjective.
$\langle 2\rangle 2$. LET: $x, y : B \to X$

2.3 Sections and Retractions

Definition 2.18 (Section, Retraction)**.** In a category, let $r : A \to B$ and $s : B \to A$. Then r is a *retraction* of s, and s is a *section* of r, iff $r \circ s = \mathrm{id}_B$.

□

Proposition 2.23. *Every retraction is epi.*

PROOF: Dual. □

Proposition 2.24. *In* **Set***, every epimorphism has a retraction.*

PROOF: By the Axiom of Choice. □

Example 2.25. It is not true in general that every monomorphism in any category has a section. nor that every epimorphism in any category has a retraction.

In the category **2**, the morphism $0 \leq 1$ is monic and epi but has no retraction or section.

2.4 Isomorphisms

Definition 2.26 (Isomorphism)**.** In a category $\mathcal{C}$, a morphism $f : A \to B$ is an *isomorphism*, denoted $f : A \cong B$, iff there exists a morphism $f^{-1} : B \to A$, the *inverse* of f, such that $f^{-1} \circ f = \mathrm{id}_A$ and $f \circ f^{-1} = \mathrm{id}_B$.

An *automorphism* on an object A is an isomorphism between A and itself. We write $\mathrm{Aut}_{\mathcal{C}}(A)$ for the set of all automorphisms on A.

Objects A and B are *isomorphic*, $A \cong B$, iff there exists an isomorphism between them.

Proposition 2.27. *The inverse of an isomorphism is unique.*

PROOF: Proposition 2.20. □

Proposition 2.28. *For any object A we have $\mathrm{id}_A : A \cong A$ and $\mathrm{id}_A^{-1} = \mathrm{id}_A$.*

PROOF: Immediate from definitions. □

Proposition 2.30. *If $f : A \cong B$ and $g : B \cong C$ then $g \circ f : A \cong C$ and $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$.*

PROOF: From Proposition 2.21. □

Definition 2.31 (Groupoid)**.** A *groupoid* is a category in which every morphism is an isomorphism.

2.5 Initial and Terminal Objects

Definition 2.32 (Initial Object)**.** An object I in a category is *initial* iff, for any object X, there is exactly one morphism $I \to X$.

Example 2.33. The empty set is the initial object in **Set**.

Definition 2.34 (Terminal Object)**.** An object T in a category is *terminal* iff, for any object X, there is exactly one morphism $X \to T$.

Example 2.35. Every singleton is terminal in **Set**.

Proposition 2.36. *If I and J are initial in a category, then there exists a unique isomorphism $I \cong J$.*

PROOF:
⟨1⟩1. LET: i be the unique morphism $I \to J$.
⟨1⟩2. LET: i^{-1} be the unique morphism $J \to I$.
⟨1⟩3. $i \circ i^{-1} = \mathrm{id}_J$
  PROOF: Since there is only one morphism $J \to J$.
⟨1⟩4. $i^{-1} \circ i = \mathrm{id}_I$

Proof: Since there is only one morphism $I \to I$.
□

Proposition 2.37. *If S and T are terminal in a category, then there exists a unique isomorphism $S \cong T$.*

Proof: Dual. □

Chapter 3

Functors

Definition 3.1 (Functor)**.** Let $\mathcal{C}$ and $\mathcal{D}$ be categories. A *functor* $F : \mathcal{C} \to \mathcal{D}$ consists of:

- for every object $A \in \mathcal{C}$, an object $FA \in \mathcal{D}$
- for any morphism $f : A \to B : \mathcal{C}$, a morphism $Ff : FA \to FB : \mathcal{D}$

such that:

- $F\mathrm{id}_A = \mathrm{id}_{FA}$
- $F(g \circ f) = Fg \circ Ff$

Definition 3.2 (Identity Functor)**.** For any category $\mathcal{C}$, the *identity functor* $1_{\mathcal{C}} : \mathcal{C} \to \mathcal{C}$ is defined by

$$1_{\mathcal{C}}A = A$$
$$1_{\mathcal{C}}f = f$$

Definition 3.3 (Constant Functor)**.** Given categories $\mathcal{C}$, $\mathcal{D}$ and an object $D \in \mathcal{D}$, the *constant functor* $K^{\mathcal{C}}D : \mathcal{C} \to \mathcal{D}$ is the functor defined by

$$K^{\mathcal{C}}DC = D$$
$$K^{\mathcal{C}}Df = \mathrm{id}_D$$

3.1 Comma Categories

Definition 3.4 (Comma Category)**.** Let $F : \mathcal{C} \to \mathcal{E}$ and $G : \mathcal{D} \to \mathcal{E}$ be functors. The *comma category* $F \downarrow G$ is the category with:

- objects all pairs (C, D, f) where $C \in \mathcal{C}$, $D \in \mathcal{D}$ and $f : FC \to GD : \mathcal{E}$

- morphisms $(u, v) : (C, D, f) \to (C', D', g)$ all pairs $u : C \to C' : \mathcal{C}$ and $v : D \to D' : \mathcal{D}$ such that the following diagram commutes:

$$\begin{array}{ccc} FC & \xrightarrow{f} & GD \\ \downarrow{\scriptstyle Fu} & & \downarrow{\scriptstyle Gv} \\ FC' & \xrightarrow{g} & GD' \end{array}$$

Definition 3.5 (Slice Category)**.** Let $\mathcal{C}$ be a category and $A \in \mathcal{C}$. The *slice category* over A, denoted $\mathcal{C}/A$, is the comma category $1_{\mathcal{C}} \downarrow K^{\mathbf{1}}A$.

Definition 3.6 (Coslice Category)**.** Let $\mathcal{C}$ be a category and $A \in \mathcal{C}$. The *coslice category* over A, denoted $\mathcal{C} \backslash A$, is the comma category $K^{\mathbf{1}}A \downarrow 1_{\mathcal{C}}$.

Definition 3.7 (Pointed Sets)**.** The *category of pointed sets* $\mathbf{Set}_*$ is the coslice category $\mathbf{Set} \backslash 1$.

Semigroups

Definition 4.1 (Semigroup)**.** A *semigroup* consists of a set S and an associative binary operation $\cdot$ on S.

Chapter 5

Monoids

Definition 5.1 (Monoid)**.** A *monoid* consists of a semigroup M such that there exists $e \in M$, the *unit*, such that, for all $x \in M$, we have $xe = ex = x$.

We identify a monoid M with the category with one object whose morphisms are the elements of M, with composition given by $\cdot$.

Proposition 5.2. *The identity in a group is unique.*

PROOF: Proposition 2.2.

Chapter 6

Groups

Definition 6.1 (Group)**.** Let $\mathcal{C}$ be a category with finite products. A *group (object)* in $\mathcal{C}$ consists of an object $G \in \mathcal{C}$ and morphisms

$$m : G^2 \to G, e : 1 \to G, i : G \to G$$

such that the following diagrams commute.

$$\begin{tikzcd}
G^3 \arrow[r, "m\times \mathrm{id}_G"] \arrow[d, "\mathrm{id}_G\times m"] & G^2 \arrow[d, "m"] \\
G^2 \arrow[r, "m"] & G
\end{tikzcd}$$

$$\begin{tikzcd}
1\times G \arrow[r, "e\times \mathrm{id}_G"] \arrow[dr, "\cong"] & G^2 \arrow[d, "m"] \\
& G
\end{tikzcd}
\qquad
\begin{tikzcd}
G\times 1 \arrow[r, "\mathrm{id}_G\times e"] \arrow[dr, "\cong"] & G^2 \arrow[d, "m"] \\
& G
\end{tikzcd}$$

$$\begin{tikzcd}
G \arrow[r, "\Delta"] \arrow[d] & G^2 \arrow[r, "\mathrm{id}_G\times i"] & G^2 \arrow[d, "m"] \\
1 \arrow[rr, "e"] & & G
\end{tikzcd}
\qquad
\begin{tikzcd}
G \arrow[r, "\Delta"] \arrow[d] & G^2 \arrow[r, "i\times \mathrm{id}_G"] & G^2 \arrow[d, "m"] \\
1 \arrow[rr, "e"] & & G
\end{tikzcd}$$

Definition 6.2 (Group)**.** We write just 'group' for 'group in **Set**. Thus, a *group* G consists of a set G and a binary operation $\cdot : G^2 \to G$ such that $\cdot$ is associative, and there exists $e \in G$, the *identity* element of the group, such that:

- For all $x \in G$ we have $xe = ex = x$
- For all $x \in G$, there exists $x^{-1} \in G$, the *inverse* of x, such that $xx^{-1} = x^{-1}x = e$.

The *order* of a group G, denoted $|G|$, is the number of elements in G if G is finite; otherwise we write $|G| = \infty$.

Proposition 6.3. *The inverse of an element is unique.*

PROOF: If i and j are inverses of x then $i = ixj = j$. □

Example 6.4.

- The *trivial* group is $\{e\}$ under $ee = e$.
- $\mathbb{Z}$ is a group under addition
- $\mathbb{Q}$ is a group under addition
- $\mathbb{Q} - \{0\}$ is a group under multiplication

- $\mathbb{R} - \{0\}$ is a group under multiplication
- $\mathbb{C}$ is a group under addition
- $\mathbb{C} - \{0\}$ is a group under multiplication
- $\{-1, 1\}$ is a group under multiplication
- For any category $\mathcal{C}$ and object $A \in \mathcal{C}$, we have $\mathrm{Aut}_{\mathcal{C}}(A)$ is a group under $gf = f \circ g$.

  For A a set, we call $S_A = \mathrm{Aut}_{\mathbf{Set}}(A)$ the *symmetric group* or *group of permutations* of A.
- For $n \geq 3$, the *dihedral group* D_{2n} consists of the set of rigid motions that map the regular n-gon onto itself under composition.
- Let $SL_2(\mathbb{Z}) = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix} : a, b, c, d \in \mathbb{Z}, ad - bc = 1 \right\}$ under matrix multiplication.
- The quaternionic group Q_8 is the group

  $$\{1, -1, i, -i, j, -j, k, -k\}$$

  with multiplication table

  $$\begin{array}{cccccccc}
1 & -1 & i & -i & j & -j & k & -k \\
-1 & 1 & -i & i & -j & j & -k & k \\
i & -i & -1 & 1 & k & -k & -j & j \\
-i & i & 1 & -1 & -k & k & j & -j \\

6.1 Order of an Element

Definition 6.13 (Order)**.** Let G be a group. Let $g \in G$. Then g has *finite order* iff there exists a positive integer n such that $g^n = e$. In this case, the *order* of g, denoted $|g|$, is the least positive integer n such that $g^n = e$.

Abelian Groups

Definition 8.1 (Abelian Group)**.** A group is *Abelian* iff any two elements commute.

In an Abelian group G, we often denote the group operation by $+$, the identity element by 0 and the inverse of an element g by $-g$. We write ng for g^n ($g \in G$, $n \in \mathbb{Z}$).

Example 8.2. Every group of order ≤ 4 is Abelian.

Example 8.3. For any positive integer n, we have $\mathbb{Z}/n\mathbb{Z}$ is an Abelian group under addition.

Example 8.4. S_n is not Abelian for $n \geq 3$. If $x = \begin{pmatrix} 1 & 2 \end{pmatrix}$ and $y = \begin{pmatrix} 1 & 3 & 2 \end{pmatrix}$ then $xy = \begin{pmatrix} 2 & 3 \end{pmatrix}$ and $yx = \begin{pmatrix} 1 & 3 \end{pmatrix}$.

9.1 Group Actions

Definition 9.1 (Action)**.** Let G be a group. Let A be an object of a category $\mathcal{C}$. A *(left) action* of G on A is a group homomorphism $G \to \mathrm{Aut}_{\mathcal{C}}(A)$.

It is *faithful* or *effective* iff it is injective.

Proposition 9.2. *Let A be a set. An action of the group G on the set A is given by a function $\cdot : G \times A \to A$ such that*

Rngs

Definition 10.1 (Ring)**.** A *rng* consists of a set R and binary operations $+, \cdot :$ $R^2 \to R$ such that:

- $(R, +)$ is an Abelian group
- $\cdot$ is associative.
- The *distributive properties* hold: for all $r, s, t \in R$ we have

$$(r+s)t = rt + st, \qquad r(s+t) = rs + rt \ .$$

Example 10.2.

- The *zero rng* is $\{0\}$.
- $\mathbb{Z}$, $\mathbb{Q}$, $\mathbb{R}$ and $\mathbb{C}$ are rngs.
- $2\mathbb{Z}$ is a rng.
- Given a rng R and natural number n, then the set $\mathfrak{gl}_n(R)$ of all $n \times n$ matrices with entries in R is a rng under matrix addition and matrix multiplication.
- For any set S, the power set $\mathcal{P}S$ is a rng under $A+B = (A \cup B) - (A \cap B)$ and $AB = A \cap B$.
- Given a rng R and a set S, then R^S is a rng under $(f+g)(s) = f(s)+g(s)$ and $(fg)(s) = f(s)g(s)$ for all $f, g \in R^S$ and $s \in S$.
- The set $\mathfrak{sl}_n(\mathbb{R}) = \{M \in \mathfrak{gl}_n(\mathbb{R}) : \operatorname{tr} M = 0\}$ is a rng.
- The set $\mathfrak{sl}_n(\mathbb{C}) = \{M \in \mathfrak{gl}_n(\mathbb{C}) : \operatorname{tr} M = 0\}$ is a rng.
- $\mathbb{Z}/n\mathbb{Z}$ is a rng.

- The ring $\mathbb{H}$ of *quaternions* is $\mathbb{R}^4$ under the following operations, where we write (a, b, c, d) as $a + bi + cj + dk$:

$$\begin{aligned}(a+bi+cj+dk)+(a'+b'i+c'j+d'k) &= (a+a')+(b+b')i \\ &\quad +(c+c')j+(d+d')k \\ (a+bi+cj+dk)(a'+b'i+c'j+d'k) &= (aa'-bb'-cc'-dd') \\ &\quad +(ab'+ba'+cd'-dc')i \\ &\quad +(ac'-bd'+ca'+db')j \\ &\quad +(ad'+bc'-cb'+da')k\end{aligned}$$

- For any Abelian group G, the set $\mathrm{End}_{\mathbf{Ab}}(G)$ is a ring under pointwise addition and composition.

Proposition 10.3. *In any rng R we have*

$$\forall x \in R. x0 = 0x = 0 \ .$$

⟨2⟩1. Assume: a is not a left-zero-divisor.
⟨2⟩2. Let: $ab = ac$
⟨2⟩3. $a(b - c) = 0$

Example 14.2. Ring homomorphisms do not necessarily preserve zero-divisors. The canonical homomorphism $\pi : \mathbb{Z} \to \mathbb{Z}/6\mathbb{Z}$ maps the non-zero-divisor 2 to a zero-divisor.

14.1 Polynomials

$$\sum_n a_n x^n \text{ for } \sum_n a_n n \quad .$$

Concretely, a *polynomial* in R is a sequence (a_n) in R such that there exists N such that $\forall n \geq N . a_n = 0$. We write the polynomial as

$$\sum_{n=0}^{N-1} a_n x^n = a_0 + a_1 x + a_2 x^2 + \cdots + a_{N-1} x^{N-1} \quad .$$

We write $R[x]$ for the set of all polynomials in R.

Define addition and multiplication on $R[x]$ by

$$\sum_n a_n x^n + \sum_n b_n x^n = \sum_n (a_n + b_n) x^n$$

$$\left(\sum_n a_n x^n\right)\left(\sum_n b_n x^n\right) = \sum_n \sum_{i+j=n} a_i b_j x^n$$

A *constant* is a polynomial of the form $a + 0x + 0x^2 + \cdots$ for some $a \in R$. We write $R[x_1, \ldots, x_n]$ for $R[x_1][x_2]\cdots[x_n]$.

Proposition 14.4. *For any ring R, the set of polynomials $R[x]$ is a ring.*

PROOF: Easy. □

Definition 14.5 (Degree)**.** The *degree* of a polynomial $\sum_n a_n x^n$ is the largest integer d such that $a_d \neq 0$. We take the degree of the zero polynomial to be $-\infty$.

Proposition 14.6. *Let R be a ring and $f, g \in R[x]$ be nonzero polynomials. Then*

$$\deg(f + g) \leq \max(\deg f, \deg g) \ .$$

PROOF: If $a_n + b_n \neq 0$ then $a_n \neq 0$ or $b_n \neq 0$. □

Proposition 14.7. *The function $i : n \to \mathbb{Z}[x_1, \ldots, x_n]$ that maps k to x_k is initial in the category with:*

$$\begin{tikzcd} R[x] \arrow[r, "\alpha_r"] & R \\ 1 \arrow[u, "x"] \arrow[ur, "r"'] & \end{tikzcd}$$

Proposition 14.9. *$\mathbb{Z}[x, y]$ is the coproduct of $\mathbb{Z}[x]$ and $\mathbb{Z}[y]$ in the category of commutative rings.*

PROOF: Given ring homomorphisms $f : \mathbb{Z}[x] \to R$ and $g : \mathbb{Z}[y] \to R$, the required morphism $\mathbb{Z}[x, y] \to R$ maps $p(x, y)$ to $p(f(x), g(y))$. □

Example 14.10. $\mathbb{Z}[x, y]$ is not the coproduct of $\mathbb{Z}[x]$ and $\mathbb{Z}[y]$ in **Ring**. Given $f : \mathbb{Z}[x] \to R$ and $g : \mathbb{Z}[y] \to R$ with $f(x) \neq g(y)$, the mediating morphism $\mathbb{Z}[x, y] \to R$ cannot exist since it must map xy to both $f(x)g(y)$ and $g(y)f(x)$. □

14.3 Power Series

Definition 14.12 (Power Series)**.** Let R be a ring. A *power series* in R is a sequence (a_n) in R. We write the power series as

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \cdots \quad .$$

We write $R[[x]]$ for the set of all power series in R.

Define addition and multiplication on $R[[x]]$ by

$$\sum_n a_n x^n + \sum_n b_n x^n = \sum_n (a_n + b_n) x^n$$

$$\left(\sum_n a_n x^n\right)\left(\sum_n b_n x^n\right) = \sum_n \sum_{i+j=n} a_i b_j x^n$$

  ⟨2⟩2. $a_0 b_0 = b_0 a_0 = 1$
⟨1⟩2. If a_0 is a unit then $\sum_n a_n x^n$ is a unit.
  Proof: Define the sequence (b_n) in R by

$$b_n = -{a_0}^{-1} \sum_{i=1}^{n} a_i b_{n-i}$$

  Then $\sum_n b_n x^n$ is the inverse of $\sum_n a_n x^n$.
