Foundations

This is a placeholder — I am not sure what foundation I want to use for this project yet. I will try to work in a way which is foundation-independent. What I do could be formalized in ZFC, ETCS, or some other system. I will assume the usual set theoretic constructions as needed. Sets will be defined up to bijection only.

Number Theory

2.1 Congruence

Definition 2.1 (Congruence). Let a, b, n be integers with $n > 0$. We say a is *congruent* to b *modulo* n, and write $a \equiv b \mod n$, iff $n \mid b - a$.

Proposition 2.2. *For n a positive integer, congruence modulo n is an equivalence relation.*

PROOF:
$\langle 1 \rangle 1$. For any integer a we have $a \equiv a \mod n$.
  PROOF: Since $n \mid 0 = a - a$.
$\langle 1 \rangle 2$. If $a \equiv b \mod n$ then $b \equiv a \mod n$.
  PROOF: If $n \mid b - a$ then $n \mid a - b = -(b - a)$.
$\langle 1 \rangle 3$. If $a \equiv b \mod n$ and $b \equiv c \mod n$ then $a \equiv c \mod n$.
  PROOF: If $n \mid b - a$ and $n \mid c - b$ then $n \mid c - a = (c - b) + (b - a)$.
$\square$

Definition 2.3. Let $\mathbb{Z}/n\mathbb{Z}$ be the quotient set of $\mathbb{Z}$ with respect to congruence modulo n.

Proposition 2.4. *$\mathbb{Z}/n\mathbb{Z}$ has exactly n elements.*

PROOF: Every integer is congruent to one of 0, 1, ..., $n - 1$ by the division algorithm, and no two of them are conguent to one another, since if $0 \leq i < j < n$ then $0 < j - i < n$. $\square$

Proposition 2.5. *If $a \equiv a' \mod n$ and $b \equiv b' \mod n$ then $a + b \equiv a' + b' \mod n$.*

PROOF: If $n \mid a' - a$ and $n \mid b' - b$ then $n \mid (a' + b') - (a + b)$. $\square$

Proposition 2.6. *If $a \equiv a' \mod n$ and $b \equiv b' \mod n$ then $ab \equiv a'b' \mod n$.*

PROOF: If $n \mid a' - a$ and $n \mid b' - b$ then $n \mid a'b' - ab = a'(b' - b) + (a' - a)b$. $\square$

2.2   Euler's ϕ-function

Definition 2.7. For n a positive integer, let $(\mathbb{Z}/n\mathbb{Z})^* = \{m \in \mathbb{Z}/n\mathbb{Z} : \gcd(m, n) = 1\}$.

PROOF: We prove this is well-defined.
$\langle 1 \rangle 1$. If $m \equiv m' \mod n$ and $\gcd(m, n) = 1$ then $\gcd(m', n) = 1$.
   $\langle 2 \rangle 1$. PICK integers a, b such that $am + bn = 1$
   $\langle 2 \rangle 2$. PICK an integer c such that $m' - m = cn$
   $\langle 2 \rangle 3$. $am' + (b - ac)n = 1$
$\square$

Definition 2.8. For n a positive integer, let $\phi(n) = |(\mathbb{Z}/n\mathbb{Z})^*|$.

Proposition 2.9. *If n is an odd positive integer then $\phi(2n) = \phi(n)$.*

PROOF:
$\langle 1 \rangle 1$. LET: n be an odd positive integer.
$\langle 1 \rangle 2$. For any integer m, if $\gcd(m, n) = 1$ then $\gcd(2m + n, 2n) = 1$
   PROOF: For p a prime, if $p \mid 2m + n$ and $p \mid 2n$ then $p \neq 2$ (since $2m + n$ is odd) so $p \mid n$ and hence $p \mid m$, which is a contradiction.
$\langle 1 \rangle 3$. For any integer r, if $\gcd(r, 2n) = 1$ then $\gcd(\frac{r+n}{2}, n) = 1$
   PROOF: If $p \mid n$ and $p \mid \frac{r+n}{2}$ then $p \mid r + n$ so $p \mid r$ which is a contradiction.
$\langle 1 \rangle 4$. The function that maps m to $2m + n$ is a bijection between $(\mathbb{Z}/n\mathbb{Z})^*$ and $(\mathbb{Z}/2n\mathbb{Z})^*$.
$\square$

Categories

Definition 3.1 (Category). A *category* $\mathcal{C}$ consists of:

- A class $|\mathcal{C}|$ of *objects*. We write $A \in \mathcal{C}$ for $A \in |\mathcal{C}|$.

- For any objects A, B, a set $\mathcal{C}[A, B]$ of *morphisms* from A to B. We write $f : A \to B$ for $f \in \mathcal{C}[A, B]$.

- For any object A, a morphism $\mathrm{id}_A : A \to A$, the *identity* morphism on A.

- For any morphisms $f : A \to B$ and $g : B \to C$, a morphism $g \circ f : A \to C$, the *composite* of f and g.

such that:

Associativity Given $f : A \to B$, $g : B \to C$ and $h : C \to D$, we have
$$h \circ (g \circ f) = (h \circ g) \circ f$$

Left Unit Law For any morphism $f : A \to B$, we have $\mathrm{id}_B \circ f = f$.

Right Unit Law For any morphism $f : A \to B$, we have $f \circ \mathrm{id}_A = f$.

Proposition 3.2. *The identity morphism on an object is unique.*

PROOF: If i and j are identity morphisms on A then $i = i \circ j = j$. $\square$

Example 3.3 (Category of Sets). The *category of sets* **Set** has objects all sets and morphisms all functions.

Definition 3.4 (Endomorphism). In a category $\mathcal{C}$, an *endomorphism* on an object A is a morphism $A \to A$. We write $\mathrm{End}_\mathcal{C}(A)$ for $\mathcal{C}[A, A]$.

Definition 3.5 (Opposite Category). For any category $\mathcal{C}$, the *opposite* category $\mathcal{C}^{\mathrm{op}}$ is the category with the same objects as $\mathcal{C}$ and

$$\mathcal{C}^{\mathrm{op}}[A, B] = \mathcal{C}[B, A]$$

3.1 Preorders

Definition 3.6 (Preorder). A *preorder* on a set A is a relation $\leq$ on A that is reflexive and transitive.

A *preordered set* is a pair $(A, \leq)$ such that $\leq$ is a preorder on A. We usually write A for the preordered set $(A, \leq)$.

We identify any preordered set A with the category whose objects are the elements of A, with one morphism $a \to b$ iff $a \leq b$, and no morphism $a \to b$ otherwise.

Example 3.7. For any ordinal α, let α be the preorder $\{\beta : \beta < \alpha\}$ under $\leq$.

Definition 3.8 (Discrete Preorder). We identify any set A with the *discrete* preorder $(A, =)$.

3.2 Monomorphisms and Epimorphisms

Definition 3.9 (Monomorphism). In a category, let $f : A \to B$. Then f is a *monomorphism* or *monic* iff, for every object X and morphism $x, y : X \to A$, if $fx = fy$ then $x = y$.

Definition 3.10 (Epimorphism). In a category, let $f : A \to B$. Then f is a *epimorphism* or *epi* iff, for every object X and morphism $x, y : B \to X$, if $xf = yf$ then $x = y$.

Proposition 3.11. *The composite of two monomorphism is monic.*

PROOF:
$\langle 1 \rangle 1$. LET: $f : A \rightarrowtail B$ and $g : B \rightarrowtail C$ be monic.
$\langle 1 \rangle 2$. LET: $x, y : X \to A$
$\langle 1 \rangle 3$. ASSUME: $g \circ f \circ x = g \circ f \circ y$

   ⟨2⟩7. $x = y$

⟨1⟩3. If f is injective then f is monic.

   ⟨2⟩1. ASSUME: f is injective.

   ⟨2⟩2. LET: X be a set and $x, y : X \to A$.

   ⟨2⟩4. $x \neq y$

   ⟨2⟩5. $x \circ f \neq y \circ f$

   ⟨2⟩6. There exists $a \in A$ such that $f(a) = b$.

⟨1⟩3. If f is surjective then f is an epimorphism.

   ⟨2⟩1. ASSUME: f is surjective.

   ⟨2⟩2. LET: $x, y : B \to X$

   ⟨2⟩3. ASSUME: $x \circ f = y \circ f$

     PROVE: $x = y$

   ⟨2⟩4. LET: $b \in B$

     PROVE: $x(b) = y(b)$

   ⟨2⟩5. PICK $a \in A$ such that $f(a) = b$

   ⟨2⟩6. $x(f(a)) = y(f(a))$

   ⟨2⟩7. $x(b) = y(b)$

Proposition 3.17. *In a preorder, every morphism is monic and epi.*

PROOF: Immediate from definitions. $\square$

3.3   Sections and Retractions

Definition 3.18 (Section, Retraction). In a category, let $r : A \rightarrow B$ and $s : B \rightarrow A$. Then r is a *retraction* of s, and s is a *section* of r, iff $r \circ s = \mathrm{id}_B$.

Proposition 3.19. *Every identity morphism is a section and retraction of itself.*

PROOF: Immediate from definitions. $\square$

\begin{aligned}
r &= r \circ \mathrm{id}_A \\
  &= r \circ s \circ r' \\
  &= \mathrm{id}_B \circ r' \\
  &= r' \qquad\qquad\qquad\qquad\qquad\quad \square
\end{aligned}
$$

Proposition 3.21. *Let $r_1 : A \rightarrow B$, $r_2 : B \rightarrow C$, $s_1 : B \rightarrow A$ and $s_2 : C \rightarrow B$. If r_1 is a retraction of s_1 and r_2 is a retraction of s_2 then $r_2 \circ r_1$ is a retraction of $s_1 \circ s_2$.*

PROOF:
$$

r_2 \circ r_1 \circ s_1 \circ s_2 &= r_2 \circ \mathrm{id}_B \circ s_2 \\
                                  &= r_2 \circ s_2 \\
                                  &= \mathrm{id}_C \qquad\qquad\qquad\qquad \square

Proposition 3.22. *Every section is monic.*

PROOF:
$\langle 1 \rangle 1.$ LET: $s : A \rightarrow B$ be a section of $r : B \rightarrow A$.
$\langle 1 \rangle 2.$ LET: $x, y : X \rightarrow A$ satisfy $sx = sy$.
$\langle 1 \rangle 3.$ $rsx = rsy$

$\square$

Proposition 3.23. *Every retraction is epi.*

PROOF: Dual. $\square$

Proposition 3.24. *In **Set**, every epimorphism has a retraction.*

PROOF: By the Axiom of Choice. $\square$

Example 3.25. It is not true in general that every monomorphism in any category has a section. nor that every epimorphism in any category has a retraction.

In the category **2**, the morphism $0 \leq 1$ is monic and epi but has no retraction or section.

3.4 Isomorphisms

Definition 3.26 (Isomorphism). In a category $\mathcal{C}$, a morphism $f : A \to B$ is an *isomorphism*, denoted $f : A \cong B$, iff there exists a morphism $f^{-1} : B \to A$, the *inverse* of f, such that $f^{-1} \circ f = \text{id}_A$ and $f \circ f^{-1} = \text{id}_B$.

An *automorphism* on an object A is an isomorphism between A and itself. We write $\text{Aut}_{\mathcal{C}}(A)$ for the set of all automorphisms on A.

Objects A and B are *isomorphic*, $A \cong B$, iff there exists an isomorphism between them.

Proposition 3.27. *The inverse of an isomorphism is unique.*

PROOF: Proposition 3.20. $\square$

Proposition 3.28. *For any object A we have $\text{id}_A : A \cong A$ and $\text{id}_A^{-1} = \text{id}_A$.*

Proposition 3.29. *If $f : A \cong B$ then $f^{-1} : B \cong A$ and $(f^{-1})^{-1} = f$.*

PROOF: Immediate from definitions. $\square$

Proposition 3.30. *If $f : A \cong B$ and $g : B \cong C$ then $g \circ f : A \cong C$ and $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$.*

PROOF: From Proposition 3.21. $\square$

Definition 3.31 (Groupoid). A *groupoid* is a category in which every morphism is an isomorphism.

3.5 Initial and Terminal Objects

Definition 3.32 (Initial Object). An object I in a category is *initial* iff, for any object X, there is exactly one morphism $I \to X$.

Example 3.33. The empty set is the initial object in **Set**.

Definition 3.34 (Terminal Object). An object T in a category is *terminal* iff, for any object X, there is exactly one morphism $X \to T$.

Example 3.35. Every singleton is terminal in **Set**.

Proposition 3.36. *If I and J are initial in a category, then there exists a unique isomorphism $I \cong J$.*

PROOF:
$\langle 1 \rangle 1$. LET: i be the unique morphism $I \to J$.
$\langle 1 \rangle 2$. LET: i^{-1} be the unique morphism $J \to I$.
$\langle 1 \rangle 3$. $i \circ i^{-1} = \text{id}_J$
    PROOF: Since there is only one morphism $J \to J$.
$\langle 1 \rangle 4$. $i^{-1} \circ i = \text{id}_I$

PROOF: Dual. ◻

Chapter 4

Functors

Definition 4.1 (Functor). Let $\mathcal{C}$ and $\mathcal{D}$ be categories. A *functor* $F : \mathcal{C} \to \mathcal{D}$ consists of:

- for every object $A \in \mathcal{C}$, an object $FA \in \mathcal{D}$

- for any morphism $f : A \to B : \mathcal{C}$, a morphism $Ff : FA \to FB : \mathcal{D}$

such that:

- $F\mathrm{id}_A = \mathrm{id}_{FA}$

- $F(g \circ f) = Fg \circ Ff$

Definition 4.2 (Identity Functor). For any category $\mathcal{C}$, the *identity functor* $1_{\mathcal{C}} : \mathcal{C} \to \mathcal{C}$ is defined by

$$1_{\mathcal{C}}A = A$$
$$1_{\mathcal{C}}f = f$$

Definition 4.3 (Constant Functor). Given categories $\mathcal{C}$, $\mathcal{D}$ and an object $D \in \mathcal{D}$, the *constant functor* $K^{\mathcal{C}}D : \mathcal{C} \to \mathcal{D}$ is the functor defined by

$$K^{\mathcal{C}}DC = D$$
$$K^{\mathcal{C}}Df = \mathrm{id}_D$$

4.1 Comma Categories

Definition 4.4 (Comma Category). Let $F : \mathcal{C} \to \mathcal{E}$ and $G : \mathcal{D} \to \mathcal{E}$ be functors. The *comma category* $F \downarrow G$ is the category with:

- objects all pairs (C, D, f) where $C \in \mathcal{C}$, $D \in \mathcal{D}$ and $f : FC \to GD : \mathcal{E}$

- morphisms $(u, v) : (C, D, f) \to (C', D', g)$ all pairs $u : C \to C' : \mathcal{C}$ and $v : D \to D' : \mathcal{D}$ such that the following diagram commutes:

$$
\begin{array}{ccc}
FC & \xrightarrow{\ f\ } & GD \\
\downarrow{\scriptstyle Fu} & & \downarrow{\scriptstyle Gv} \\
FC' & \xrightarrow{\ g\ } & GD'
\end{array}
$$

Definition 4.5 (Slice Category). Let $\mathcal{C}$ be a category and $A \in \mathcal{C}$. The *slice category* over A, denoted $\mathcal{C}/A$, is the comma category $1_\mathcal{C} \downarrow K^{\mathbf{1}}A$.

Definition 4.6 (Coslice Category). Let $\mathcal{C}$ be a category and $A \in \mathcal{C}$. The *coslice category* over A, denoted $\mathcal{C}\backslash A$, is the comma category $K^{\mathbf{1}}A \downarrow 1_\mathcal{C}$.

Definition 4.7 (Pointed Sets). The *category of pointed sets* $\mathbf{Set}_*$ is the coslice category $\mathbf{Set}\backslash 1$.

Group Theory

Chapter 5

Groups

Definition 5.1 (Group)**.** A *group* G consists of a set G and a binary operation $\cdot : G^2 \to G$ such that $\cdot$ is associative, and there exists $e \in G$, the *identity* element of the group, such that:

- For all $x \in G$ we have $xe = ex = x$

- For all $x \in G$, there exists $x^{-1} \in G$, the *inverse* of x, such that $xx^{-1} = x^{-1}x = e$.

We identify a group G with the category G with one object and morphisms the elements of G, with composition given by $\cdot$.

The *order* of a group G, denoted $|G|$, is the number of elements in G if G is finite; otherwise we write $|G| = \infty$.

- $\mathbb{C} - \{0\}$ is a group under multiplication

- The set of 2×2 real matrices with non-zero determinant is a group under matrix multiplication.

- For any positive integer n, the set $\mathbb{Z}/n\mathbb{Z}$ of integers modulo n under addition is a group.

- For any category $\mathcal{C}$ and object $A \in \mathcal{C}$, we have $\text{Aut}_{\mathcal{C}}(A)$ is a group under $gf = f \circ g$.

  For A a set, we call $S_A = \text{Aut}_{\textbf{Set}}(A)$ the *symmetric group* or *group of permutations* of A.

- For $n \geq 3$, the *dihedral group* D_{2n} consists of the set of rigid motions that map the regular n-gon onto itself under composition.

- The only group of order 2 is $\mathbb{Z}_2$.

- The only group of order 3 is $\mathbb{Z}_3$.

- There are exactly two groups of order 4: $\mathbb{Z}_4$ and $\mathbb{Z}_2 \times \mathbb{Z}_2$ under $(a, b)(c, d) = (ac, bd)$.

Example 5.6. For any positive integer n, the set

   If g does not have finite order, we write $|g| = \infty$.

Abelian Groups

Definition 7.1 (Abelian Group). A group is *Abelian* iff any two elements commute.

In an Abelian group G, we often denote the group operation by $+$, the identity element by 0 and the inverse of an element g by $-g$. We write ng for g^n ($g \in G$, $n \in \mathbb{Z}$).

Example 7.2. Every group of order ≤ 4 is Abelian.

Example 7.3. For any positive integer n, we have $\mathbb{Z}/n\mathbb{Z}$ is an Abelian group under addition.

Example 7.4. S_n is not Abelian for $n \geq 3$. If $x = \begin{pmatrix} 1 & 2 \end{pmatrix}$ and $y = \begin{pmatrix} 1 & 3 & 2 \end{pmatrix}$ then $xy = \begin{pmatrix} 2 & 3 \end{pmatrix}$ and $yx = \begin{pmatrix} 1 & 3 \end{pmatrix}$.

Example 7.5. There are 42 Abelian groups of order 1024 up to isomorphism.

Definition 7.31. Let $\mathrm{SL}_n(\mathbb{C}) = \{M \in \mathrm{GL}_n(\mathbb{C}) : \det M = 1\}$.

Definition 7.32. Let $\mathrm{O}_n(\mathbb{R}) = \{M \in \mathrm{GL}_n(\mathbb{R}) : MM^{\mathrm{T}} = M^{\mathrm{T}}M = I_n\}$.

Definition 7.33. Let $\mathrm{SO}_n(\mathbb{R}) = \{M \in \mathrm{O}_n(\mathbb{R}) : \det M = 1\}$.

Definition 7.34. Let $\mathrm{U}_n(\mathbb{C}) = \{M \in \mathrm{GL}_n(\mathbb{C}) : MM^{\dagger} = M^{\dagger}M = I_n\}$.

Definition 7.35. Let $\mathrm{SU}_n(\mathbb{C}) = \{M \in U_n(\mathbb{C}) : \det M = 1\}$.

Proposition 7.36. *Every matrix in* $\mathrm{SU}_2(\mathbb{C})$ *can be written in the form*

$$\begin{pmatrix} a + bi & c + di \\ -c + di & a - bi \end{pmatrix}$$

for some $a, b, c, d \in \mathbb{R}$ *with* $a^2 + b^2 + c^2 + d^2 = 1$.

PROOF:

$\langle 1 \rangle 1$. LET: $M = \begin{pmatrix} \alpha & \beta \\ \gamma & \delta \end{pmatrix} \in \mathrm{SU}_2(\mathbb{C})$

$\langle 1 \rangle 2$. $M^{-1} = M^{\dagger}$

$\langle 1 \rangle 3$. $\begin{pmatrix} \delta & -\beta \\ -\gamma & \alpha \end{pmatrix} = \begin{pmatrix} \overline{\alpha} & \overline{\gamma} \\ \overline{\beta} & \overline{\delta} \end{pmatrix}$

$\langle 1 \rangle 4$. LET: $\alpha = a + bi$ and $\beta = c + di$.

$\langle 1 \rangle 5$. $\delta = \overline{\alpha} = a - bi$

$\langle 1 \rangle 6$. $\gamma = -\overline{\beta} = -c + di$

$\langle 1 \rangle 7$. $\det M = a^2 + b^2 + c^2 + d^2 = 1$
